SkyLog web service is used for remote monitoring and control of lifting devices

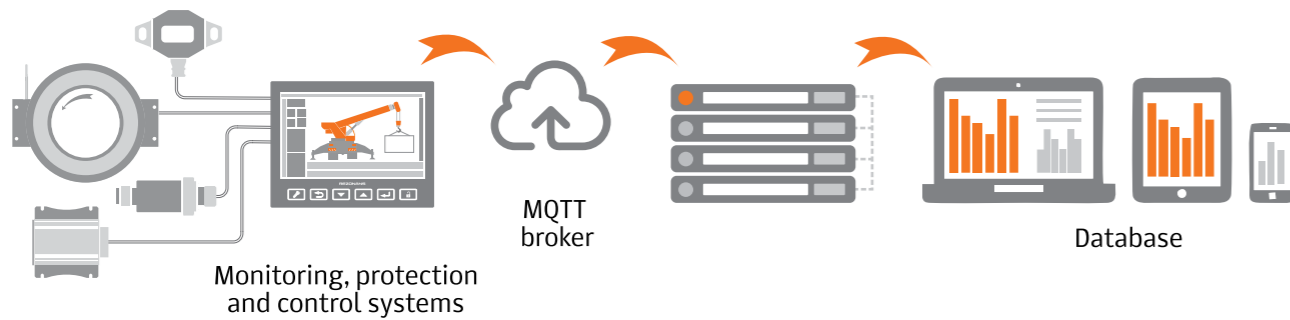

Key features:

- software update
- settings download/upload
- datalogger reading
- coordinate reading
- monitoring of changes in the datalogger
- parameter monitoring (current parameters are received more often than they are updated in the datalogger)
- signal generation for LogSystem.

Binding of display console to SkyLog

SkyLog remote monitoring technology

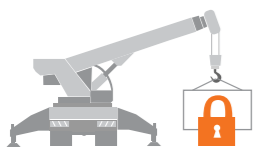

1. Receipt of file token with settings and authorization key in the Personal Account.
2. Record of file token in the display console.
3. Location of the switched on display console within the mobile network coverage area.
4. Waiting for automatic authorization and adding new device in the Personal Account.

Texting service to the display console

Skylog user can send text messages from the Personal Account to any display console linked to the Personal Account. This service can be used for remote diagnostics together with a crane operator or for sending job instructions.

The service can be used to lock down crane operation at any time from the Skylog user Personal Account. It is also possible to set deferred locking function by specifying locking date. Can be used in case of crane leasing or shipment to end users without full prepayment. The service can be used to avoid damage to the crane and personnel safety hazard in case of emergency.
